RABBITT Attoclock for the Direct Measurement of Ionization Phases

Wednesday 3 July 2019 17:00 (15 minutes)

Using a circularly polarized Attosecond Pulse Train (APT) together with a weak replica of the circularly polarized fundamental Infra-Red (IR) we reconstruct the ionization phase of the $(2s2p)^1P^o$ resonance in atomic Helium by analyzing the photoelectron momentum distribution.

Authors: DONSA, Stefan (Vienna University of Technology); DOUGUET, Nicolas (University of Central Florida); BURGDÖRFER, Joachim (Vienna University of Technology); BREZINOVA, Iva (Vienna University of Technology); ARGENTI, Luca (University of Central Florida)

Presenter: DONSA, Stefan (Vienna University of Technology)

Session Classification: Time delays and dynamics of photoionization in atoms and molecules
