Quantum Control and Ultrafast Charge Migration in Molecules in the X-ray Regime

Monday 1 July 2019 18:15 (2 hours)

In the present study, we focus on the ultrafast charge migration in the valence shell subsequent to Auger decay of a core-ionized/excited molecule. By using a two-color X-ray attosecond pump-probe scheme, we theoretically demonstrate that we can induce and measure charge migration at different sites of a molecule.
