Ultrafast Laser-assisted Stabilization of Ionized Adenine

Monday 1 July 2019 12:15 (15 minutes)

A NIR pulse following attosecond XUV-photoionization at specific time delay can prevent irreparable damage of adenine. We identify the stabilizing mechanism in electronic correlation driven charge migration away from the molecular plane.

Authors: Dr LATINI, Simone (Max Planck Institute for the Structure and Dynamics of Matter); Dr MAANSSON, Erik (Center for Free-Electron Laser Science, DESY); Ms GALLI, Mara (Politecnico di Milano); Mr WANIE, Vincent (Institut National de la Recherche Scientifique); Mr COVITO, Fabio (Max Planck Institute for the Structure and Dynamics of Matter); Dr PERFETTO, Enrico (CNR-ISM); Prof. STEFANUCCI, Gianluca (Università di Roma Tor Vergata); Dr HUEBENER, Hannes (Max Planck Institute for the Structure and Dynamics of Matter); Dr DE GIOVANNINI, Umberto (Max Planck Institute for the Structure and Dynamics of Matter); Mr CASTROVILLI, Matteo (CNR-IFN); Dr TRABATTONI, Andrea (Center for Free-Electron Laser Science, DESY); Dr FRASSETTO, Fabio (CNR-IFN); Dr POLETTI, Luca (CNR-IFN); Dr GREENWOOD, Jason (Queen's University Belfast); Prof. LEGARE, Francois (Institut National de la Recherche Scientifique); Prof. NISOLI, Mauro (Politecnico di Milano); Prof. CALEGARI, Francesca (Center for Free-Electron Laser Science, DESY); Prof. RUBIO, Angel (Max Planck Institute for the Structure and Dynamics of Matter)

Presenter: Dr LATINI, Simone (Max Planck Institute for the Structure and Dynamics of Matter)

Session Classification: Laser-induced dynamical processes in molecules
