Terahertz Lightwave Control of Solids and Single Molecules

Tuesday 2 July 2019 09:00 (30 minutes)

We switch the valley pseudospin in monolayer WSe₂ and drive all-ballistic Dirac currents on a topological insulator on subcycle scales. A lightwave-driven scanning-tunneling microscope allows for the first-ever femtosecond single-molecule videography and reaction microscopy.

Author: Prof. HUBER, Rupert (University of Regensburg)

Presenter: Prof. HUBER, Rupert (University of Regensburg)

Session Classification: High-harmonic generation in solids and liquids
